

# Introduction

# What is an algorithm?

---

- ▶ A sequence of **unambiguous** instructions for solving a problem

**FIGURE 1.1** Notion of algorithm

# Why study algorithms?

---

- ▶ **As a computer professional:**
  - ▶ Need to know a standard set of important algorithms
  - ▶ Be able to design and evaluate new algorithms
  - ▶ The study of algorithms is the core of computer science
- ▶ It is indispensable in almost all aspects of our lives
- ▶ It is useful for us to developing analytical skills

# Important Points to Remember

---

- ▶ **Nonambiguity** requirement
- ▶ Carefully specify the **range** of inputs
- ▶ Same algorithm can have different representations
- ▶ Same problem can be solved with different algorithms that may have dramatically different speeds

# An example

---

- ▶ **Problem**: computing the greatest common divisor of two integers,  $m$  and  $n$ .

- ▶ **Euclid's algorithm**:

$$\gcd(m, n) = \gcd(n, m \bmod n)$$

$$\gcd(m, 0) = m$$

$$\gcd(60, 24) = ?, \quad \gcd(60, 0) = ?, \quad \gcd(0, 0) = ?$$

# Two Descriptions

---

## Euclid's algorithm:

$$\gcd(m, n) = \gcd(n, m \bmod n) \quad \gcd(m, 0) = m$$

**Step 1:** If  $n = 0$ , return  $m$  and stop; otherwise go to Step 2

**Step 2:** Divide  $m$  by  $n$  and assign the value of the remainder to  $r$

**Step 3:** Assign the value of  $n$  to  $m$  and the value of  $r$  to  $n$ . Go to Step 1.

```
while  $n \neq 0$  do
   $r \leftarrow m \bmod n$ 
   $m \leftarrow n$ 
   $n \leftarrow r$ 
return  $m$ 
```

*Will the algorithm eventually stop? Why?*

# An example

---

- ▶ **Problem**: computing the greatest common divisor of two integers,  $m$  and  $n$ .

- ▶ **Euclid's algorithm**:

$$\gcd(m, n) = \gcd(n, m \bmod n) \quad \gcd(m, 0) = m$$

- ▶ **Consecutive integer checking algorithms**: based on the definition – the largest integer that divides  $m$  and  $n$  evenly

# Consecutive integer checking algorithms

---

- Step 1: Assign the value of  $\min\{m, n\}$  to  $t$
- Step 2: Divide  $m$  by  $t$ . If the remainder is 0, go to Step 3; otherwise, go to Step 4
- Step 3: Divide  $n$  by  $t$ . If the remainder is 0, return  $t$  and stop; otherwise, go to Step 4
- Step 4: Decrease  $t$  by 1 and go to Step 2

*Will the algorithm eventually stop? Why?*

# An example

---

- ▶ **Problem**: computing the greatest common divisor of two integers,  $m$  and  $n$ .

- ▶ **Euclid's algorithm**:

$$\gcd(m, n) = \gcd(n, m \bmod n) \quad \gcd(m, 0) = m$$

- ▶ **Consecutive integer checking algorithms**: based on the definition – the largest integer that divides  $m$  and  $n$  evenly

- ▶ **Middle-school procedure**

# Middle-school procedure

---

**Step 1:** Find the prime factorization of  $m$

**Step 2:** Find the prime factorization of  $n$

**Step 3:** Find all the common prime factors

**Step 4:** Compute the product of all the common prime factors and return it as  $\gcd(m,n)$

*Is this an algorithm?*

# Sieve of Eratosthenes

---

**Input:** Integer  $n \geq 2$

**Output:** List of primes less than or equal to  $n$

```
for  $p \leftarrow 2$  to  $n$  do  $A[p] \leftarrow p$ 
```

```
for  $p \leftarrow 2$  to  $\lfloor n \rfloor$  do
```

```
    if  $A[p] \neq 0$  //  $p$  hasn't been previously eliminated from the list
```

```
         $j \leftarrow p * p$ 
```

```
        while  $j \leq n$  do
```

```
             $A[j] \leftarrow 0$  //mark element as eliminated
```

```
             $j \leftarrow j + p$ 
```

# Discussion

---

## **Euclid's algorithm:**

$$\gcd(m, n) = \gcd(n, m \bmod n) \quad \gcd(m, 0) = m$$

- ▶ What is the smallest number of divisions made by Euclid's algorithm among all inputs  $1 \leq m, n \leq 10$ ?
- ▶ What is the largest number of divisions made by Euclid's algorithm among all inputs  $1 \leq m, n \leq 10$ ?

# Discussion (1-1)

---

## Euclid's algorithm:

$$\gcd(m, n) = \gcd(n, m \bmod n) \quad \gcd(m, 0) = m$$

- ▶ What is the smallest number of divisions made by Euclid's algorithm among all inputs  $1 \leq m, n \leq 10$ ?
  - ▶ 1 for any input pair  $m \geq n \geq 1$ , in which  $m$  is a multiple of  $n$
- ▶ What is the largest number of divisions made by Euclid's algorithm among all inputs  $1 \leq m, n \leq 10$ ?
  - ▶ 5, which is made by Euclid's algorithm in computing  $\gcd(5, 8)$ .

# Discussion (1-1)

---

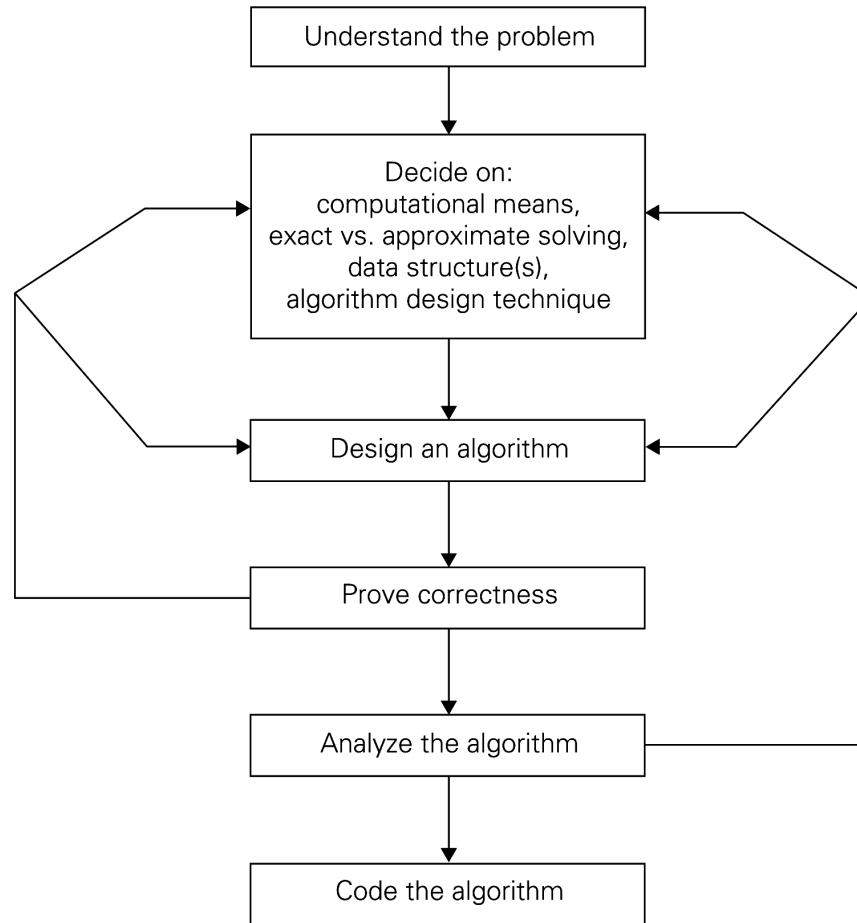

1	2	2	2	2	2	2	2	2	2
1	1	3	2	3	2	3	2	3	2

1	1	2	1	3	3	4	2	3	3
1	2	3	2	1	3	4	5	4	2
1	1	1	2	2	1	3	3	3	4
1	2	2	3	3	2	1	3	4	4
1	1	3	1	4	2	2	1	3	3
1	2	1	2	3	2	3	2	1	3
1	1	2	2	1	3	3	2	2	1

gcd(5, 8)

# Algorithm Design and Analysis

---

**FIGURE 1.2** Algorithm design and analysis process

# Algorithm Design Techniques

---

- Brute force
- Greedy Approach
- Divide and conquer
- Dynamic Programming
- Decrease and conquer
- Iterative Improvement
- Transform and conquer
- Backtracking
- Space and time tradeoffs
- Branch and bound

# Analysis of Algorithm

---

- ▶ How good is an algorithm?
  - ▶ time efficiency
  - ▶ space efficiency
- ▶ Does there exist a better algorithm?
  - ▶ lower bounds
  - ▶ optimality

# Fundamental data structures

---

- ▶ list
  - ▶ array
  - ▶ linked list
  - ▶ string
- ▶ stack
- ▶ queue
- ▶ priority queue
- graph
- tree
- set and dictionary

# Important Problem Types

---

- ▶ sorting
- ▶ searching
- ▶ string processing
- ▶ graph problems
- ▶ combinatorial problems
- ▶ geometric problems
- ▶ numerical problems

# Programming Exercise (1)

---

- ▶ Implement the three algorithms that compute the **greatest common divisor** of two integers,  $m$  and  $n$ :
    - ▶ Euclid's algorithm
    - ▶ Consecutive integer checking algorithms
    - ▶ Middle-school procedure
  - ▶ Compare the performance of these algorithms. Please try on different pairs of integers and record your findings.
    - ▶ Compare number of basic operations such as addition, subtractions, divisions, ...
- or
